

Financial Friction Analysis Report

Customized Operational Diagnostic for the **Enterprise** Industry

Based on your provided organizational parameters (a workforce of **50** employees), we have calculated the hidden financial cost of operational friction caused by manual processes, disconnected systems, and redundant data entry.

ESTIMATED ANNUAL FRICTION
COST

OMR 45,000

POTENTIAL RECOVERED VALUE

OMR 38,250

The Mechanics of Operational Friction

Our research across GCC enterprises indicates that the average employee loses approximately **520** hours annually to non-value-adding tasks. These include:

- Hunting for data across siloed systems (Excel, legacy ERPs, emails).
- Re-entering identical data into multiple unintegrated platforms.
- Waiting for manual, paper-based, or WhatsApp-driven approval chains.
- Manually compiling end-of-month financial and operational reports.

Strategic Recommendation

This financial leak is rarely visible on a P&L statement because it is buried within payroll costs. However, by deploying modular automation and establishing a Single Source of Truth (SSOT) architecture, you can recover up to 85% of this lost capital.

This recovered bandwidth can be immediately redirected toward revenue-generating activities, driving geometric growth without increasing headcount.
